Brain Tumor Detection & Monitoring Report

AI Assisted Brain MRI Diagnostic Analysis

Meningioma	Moderate	57.0%
Tumor Type	Risk Level	Confidence

Patient Information

Name	John doe	**Patient UID**	fb13308e-667a-4ba4-b6e7-3a1d664c838a
Age	0	**Sex**	Male
Blood Group	B+	**Scan Date**	2026-05-22 06:04:30

Detected Region: Posterior Fossa
Severity: Stage I
Clinical Risk: Moderate

Figure: Highlighted MRI Tumor Detection

Clinical Summary

Tumor Type	Meningioma
Tumor Location	Posterior Fossa
Risk Level	Moderate
Severity	Stage I
Detection Probability	57.0%

Detection Confidence

■■■■■■■■■■■■■■■■■■■■■

Confidence Score: 56%

AI Findings & Interpretation

This is a sample AI summary generated because GEMINI_SWITCH is set to OFF in the testing phase. The scan indicates potential abnormalities consistent with the detected tumor type. Please note this is mock data and should not be used for actual medical diagnosis. Consult a qualified specialist for accurate assessment.

■ CLINICAL NOTE: This scan indicates Meningioma, which differs from the patient's historical diagnosis of Glioma. This discrepancy may suggest a secondary neoplasm, metastatic development, or potential misclassification. A multidisciplinary review is strongly recommended to reconcile these findings with the patient's clinical history.

Progression Analysis

Compared to the previous MRI scan, the tumor shows **Sample comparison: Tumor size appears stable compared to the previous scan. This is mock data.** with an estimated growth variation of **0.0%**.

Clinical Recommendation

This AI-assisted MRI analysis indicates findings that should be clinically correlated with radiological and neurological evaluation. Further diagnostic confirmation and treatment planning should be performed by a licensed healthcare professional.
